### INVENTORY

IT Admins are responsible for a huge percentage of an organization's assets. To manage their fleet effectively, FileWave provides key functionality in network discovery, reporting, and compliance to enable success. Including powerful real-time reporting, Custom Fields, and license management, FileWave makes inventory management simple.

### PATENTED SELF-HEALING

Apply self-healing capabilities to your critical security layers, including anti-malware applications and VPN clients. Automatically detect, repair, and reinstall missing or corrupted applications and updates that have been removed or altered accidentally or maliciously.

### TRACKING

With a simple click, FileWave Administrators can map the last known location, if available, of any FileWave managed Mac, Windows, iOS, or Chromebook device, or group of devices, using our Location Tracking feature.

### REMOTE WIPE

Remotely wiping a device's memory is the last resort in the case of a lost or stolen device. FileWave's automated tools enable you to remotely wipe a device to protect personal or proprietary information from malicious use.

### SOFTWARE MANAGEMENT

You can't afford to discover surprise expenses during software rollouts. Reduce those risks with detailed inventory reporting in FileWave. Easy-to-use filters allow you to plan for hardware or OS upgrades before you purchase the software. Admins can also monitor and manage the installation of unauthorized applications. Fully informed planning optimizes your spending and your staff's time.

### PATCH MANAGEMENT

Whether deploying Apple and Microsoft OS or third-party applications, FileWave makes it easy to identify unpatched systems, and target patches for deployment to those devices. Simplify complex patch management deployments with minimal impact to network load by utilizing FileWave's Booster technology.
