# Simple, proactive, evolved cybersecurity—from supply chain to cloud.

Within the current hybrid working environment, productivity happens everywhere. And employees are often creating, collaborating, and crunching data beyond their company's firewall. So, it's vital that IT staff be able to provide the same level of device security whether employees are in the office, at their kitchen table, or at a coffee shop. With the average data breach costing $4.35M in damages, customers are seeking more complex, multi-layered defenses to act as a deterrent against hackers.

Lenovo ThinkShield offers complete protection wherever and whenever work happens.

ThinkShield

Technology you can rely on

- Lenovo embeds security into every device, taking advantage of our industry-leading partnerships to ensure device protection at the supply chain, below the OS, and from OS to cloud.

- Innovations, like BIOS firmware, remote management, and cloud security, provide a passive level of protection that every organization requires.

Security that adapts

- Our solutions are fully integrated to take advantage of the latest hardware and software technologies, and they're tested to ensure optimal protection and orchestration.

- We utilize advanced predictive technology to automate both preventive and proactive procedures, so IT teams and employees don't feel the burden.

Expertise you need

- As the leading hardware manufacturer and solutions provider, Lenovo provides unique expertise and insight on how cybersecurity has been delivered and continues to evolve.

- Custom global security services leverage our technology expertise to solve any resource gap.
